

### **ABSTRACT OF THE DISCLOSURE**

In a method and a medical system for supplying a patient with medication, a designation representing a quantity and a dosage of a medication is communicated to a data bank and, at the data bank, the point in time at which the medication will be used up is calculated. The data bank establishes contact with the patient and/or a caregiver for the patient and/or a caregiving establishment for the patient prior to the point in time calculated at the data bank, so that the patient can be supplied with replenished medication before the calculated point in time.
